

Replacing a complete set of teeth or a complete denture

Information for patients and dentists
**Implant-supported replacements
for lost natural teeth**

Replacing a complete set of teeth or a complete denture

Problem

All teeth missing

- Loose, uncomfortable or poorly fitting conventional complete denture

Solutions

Implant-supported fixed or removable complete arch bridge

- Three principal options: permanently fixed, clip-retained or SynCone-supported
- All three options support the bridge, so that it is not resting on the gums

Acrylic bridge supported by four ANKYLOS® SynCone implants

- Looks and functions just like natural teeth
- Combines the security of permanent fixing with the convenience of removable dentures
- Solid foundation for natural chewing function, but easily removable for cleaning
- Bridge made from the same material as a conventional denture
- Once implants are in place, denture can be fitted by your general dentist (after completing a short training session with DENTSPLY Implants)

The next best thing to your natural teeth

For anyone with missing or failing teeth, dental implants can totally restore natural oral function, appearance and confidence.

“Over the longer term, implants are usually a more cost-effective and satisfactory option.”

British Dental Health Foundation

Implant-supported permanently fixed porcelain bridge

- Looks and functions like natural teeth
- Only removable by a dentist, for cleaning or extraction of trapped oral debris
- The most expensive option for a patient with no teeth

Removable (clip-retained) denture

- Looks like natural teeth and can be removed for cleaning
- Some movement during normal chewing, due to necessary slack in securing clips

Alternatives

Conventional denture located with two implants

- See dentists4implants.com for details

Continue with a complete conventional denture

- Initially, cheaper than an implant-supported restoration
- Continuing impairment of eating, speech, confidence
- Bone supporting the gum beneath the denture will shrink due to lack of use
- Denture will need to be regularly relined or replaced
- The pressure from an unsupported conventional denture during chewing reduces the blood supply to the gums and contributes to accelerated bone shrinkage through resorption

ALWAYS discuss the treatment options for your case with a competent dentist.

“

What patients say about treatment provided by dentists featured on dentists4implants.com

‘The finished implants and crowns look and feel like my own teeth, only better’

‘Now I can laugh, smile, have a lot of fun and kiss with confidence’

‘Everyone has complimented me on how they look and I am delighted!’

‘I no longer have to choose from a menu the easiest dish to eat!’

‘The treatment has been worth every penny’

‘My new teeth have given me a new lease of life. I can’t stop smiling’

‘My only regret is that I didn’t do it years ago!’
